

RPW / SCM

The RPW/Search Coil Magnetometer onboard Solar Orbiter

Matthieu Kretzschmar
and the SCM team

Overall status

- SCM working nicely
- software for magnetic waveform calibration ok (updated calibration).
Quality flag to be implemented
- Several artefacts to correct or tags
- Team:
 - V. Krasnoselskih, G. Jannet, JY Brochot, T. Dudok de Wit, C. Froment, N. Colomban, one engineer being recruited

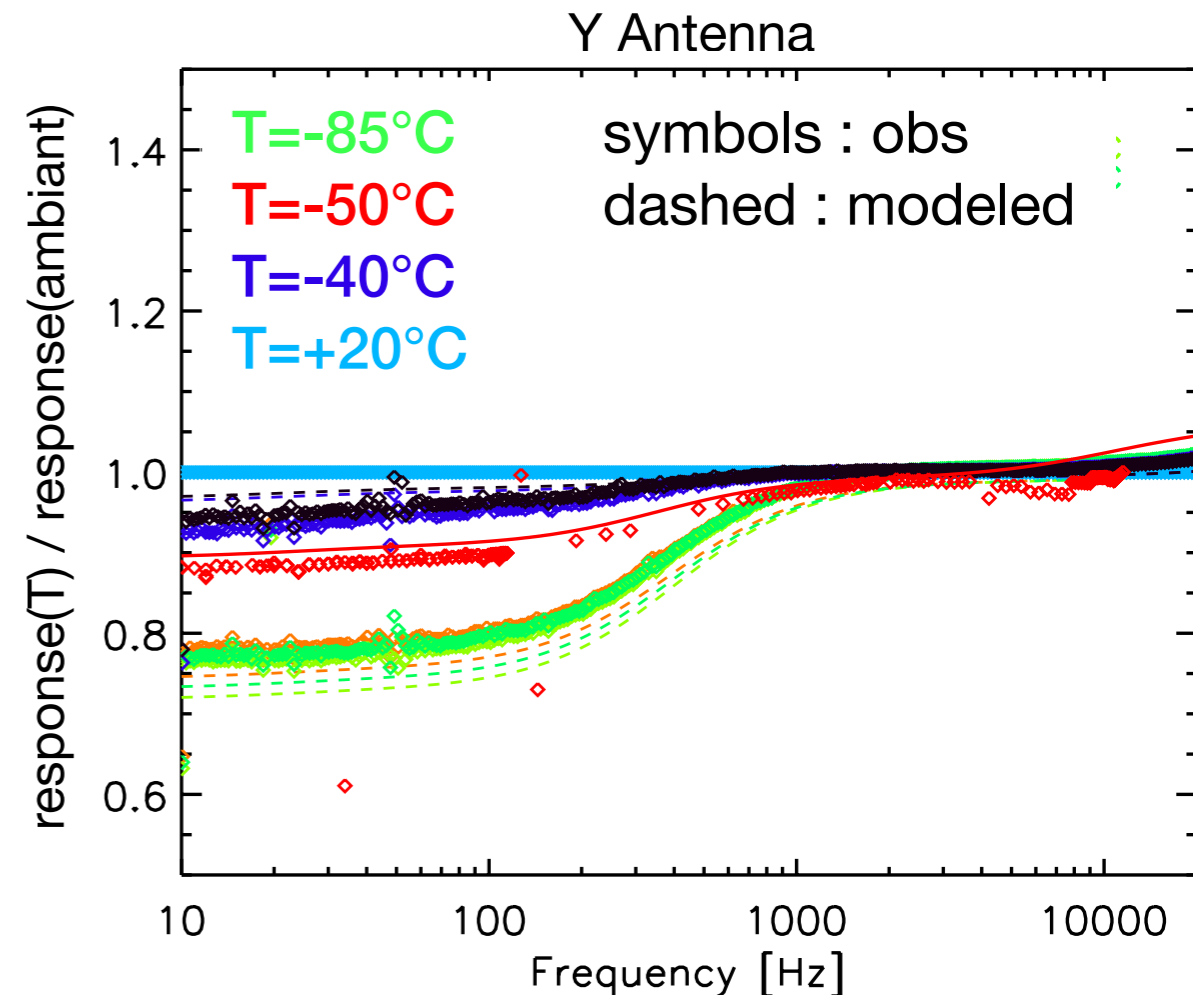

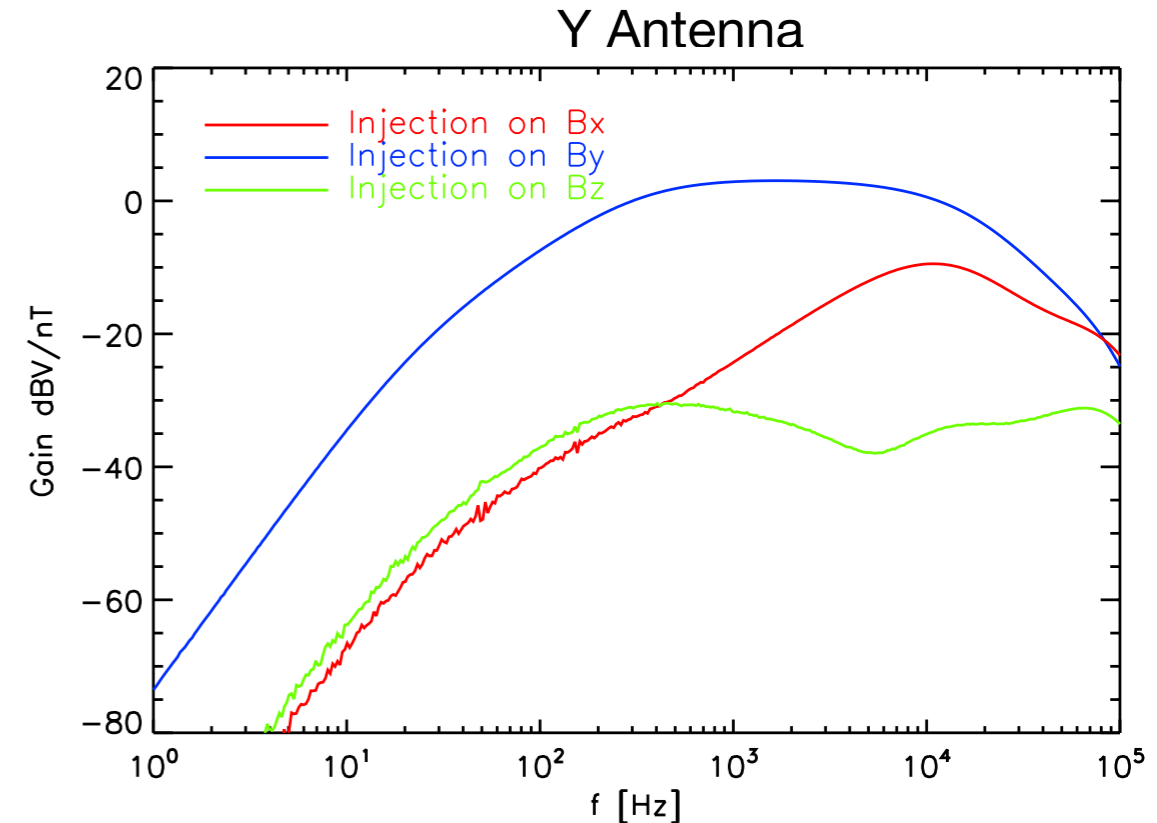

SCM Calibration

- Matricial calibration to deal with cross-talk between antennas

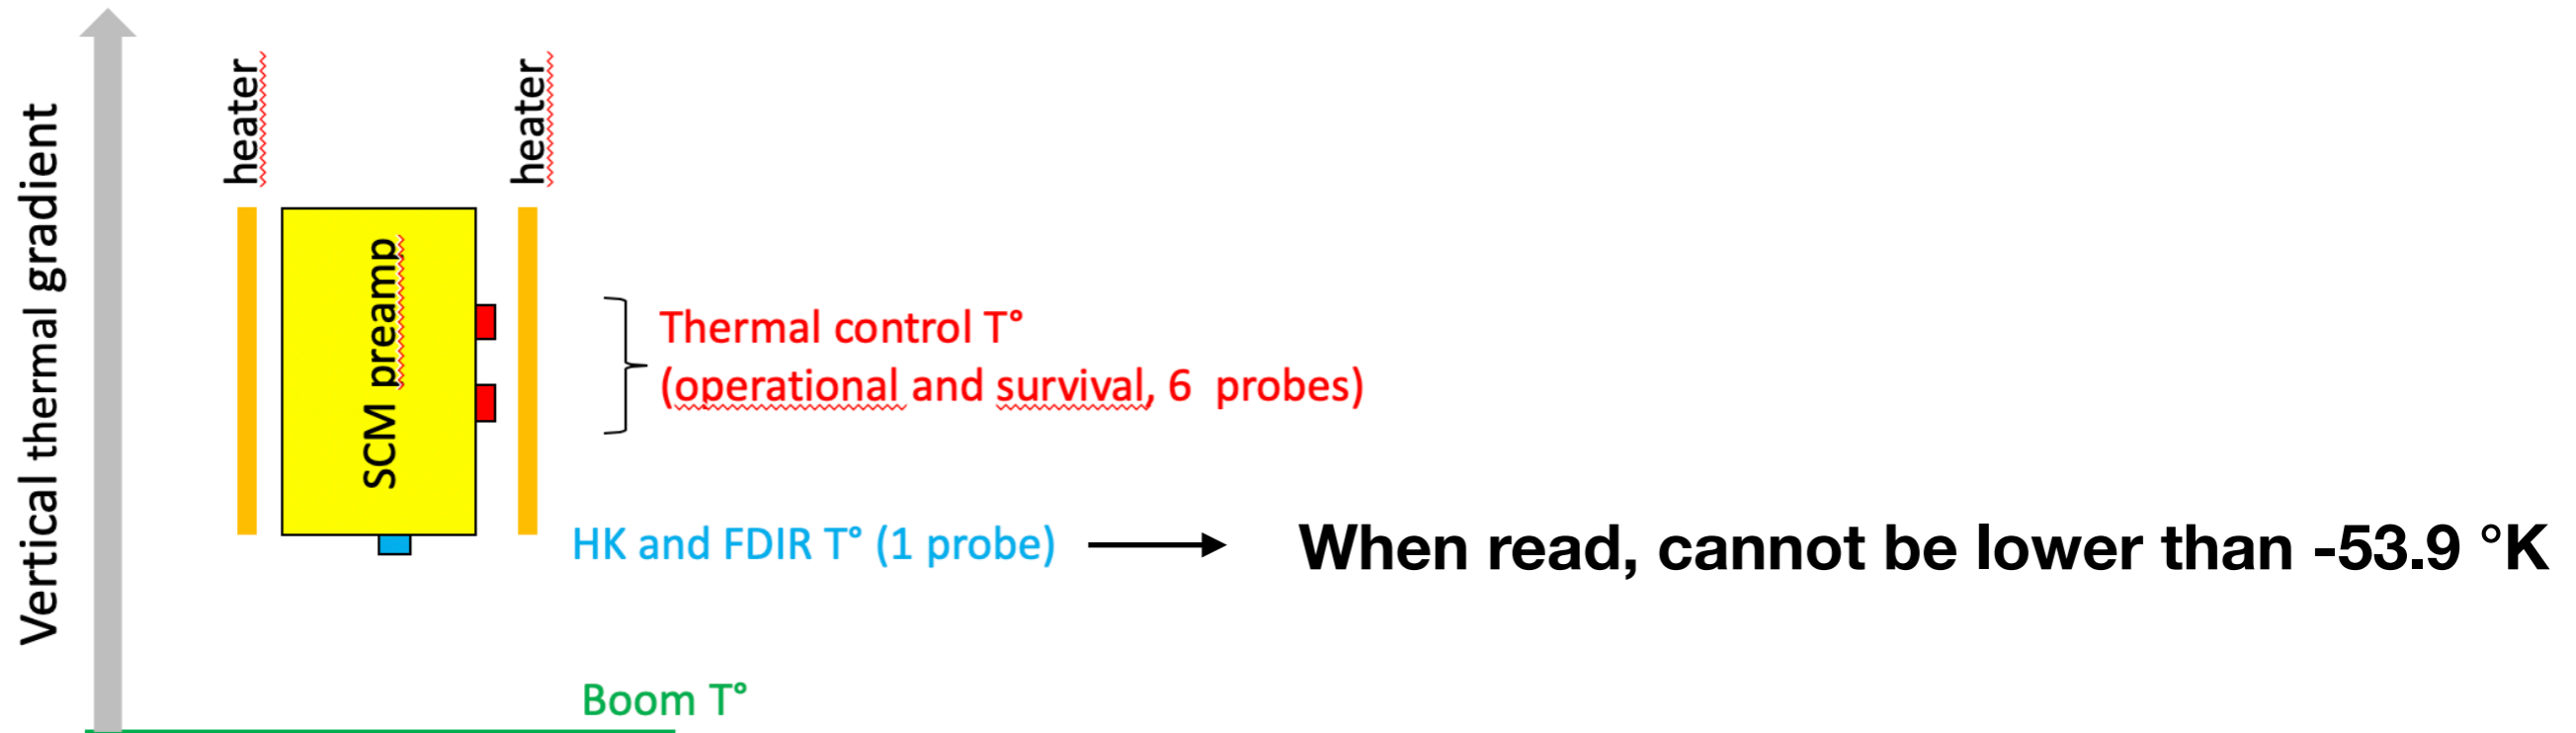

$$\begin{bmatrix} V_x \\ V_y \\ V_z \end{bmatrix} = \begin{bmatrix} R_{xx} & R_{xy} & R_{xz} \\ R_{yx} & R_{yy} & R_{yz} \\ R_{zx} & R_{zy} & R_{zz} \end{bmatrix} \begin{bmatrix} B_x \\ B_y \\ B_z \end{bmatrix}$$

- Gain is temperature dependent.

- In space, possibility to trace the frequency response

SCM Temperature

- Simulations reproduce very nicely the temperature observed during TVAC tests.
- In flight, I-boom temperature and SCM heater duty cycle are used to reproduce observed SCM heating power.

When boom temperature varies between -112° and -52° ,
SCM antenna temperature goes from -52.4° to -47.5°

Artefact signals

- EUI heaters **TBC** (1.33 & 2.66Hz)
- OBC (8Hz, 16Hz and harmonics)
- MAG driving frequency (15.36kHz and harmonics)
- RW DC converter for RW (80kHz)
- Solar Panel DC converter (120kHz)
- Others will come with EMC campaigns
- SCM heaters

SCM heaters signature

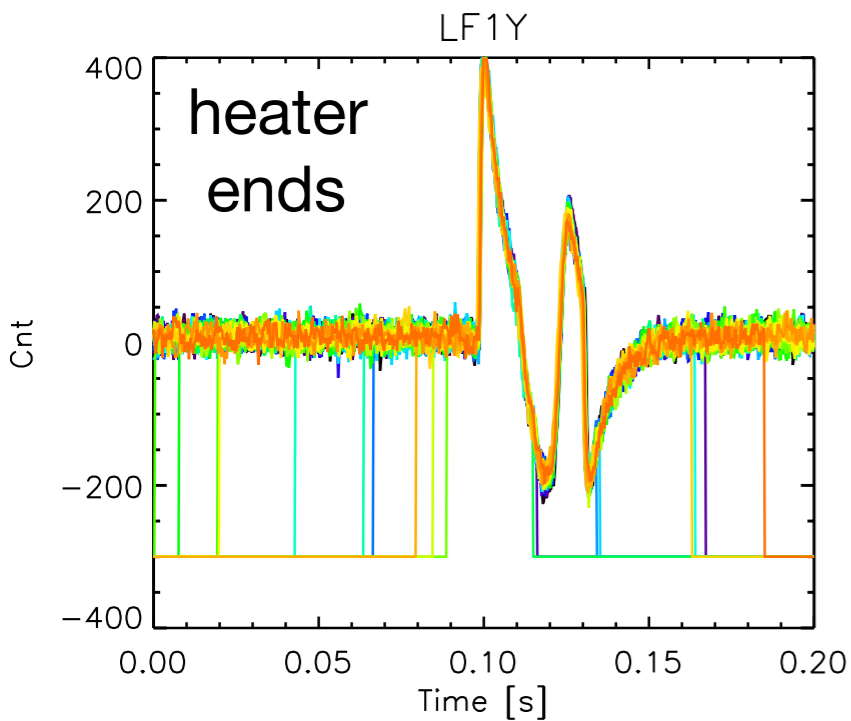

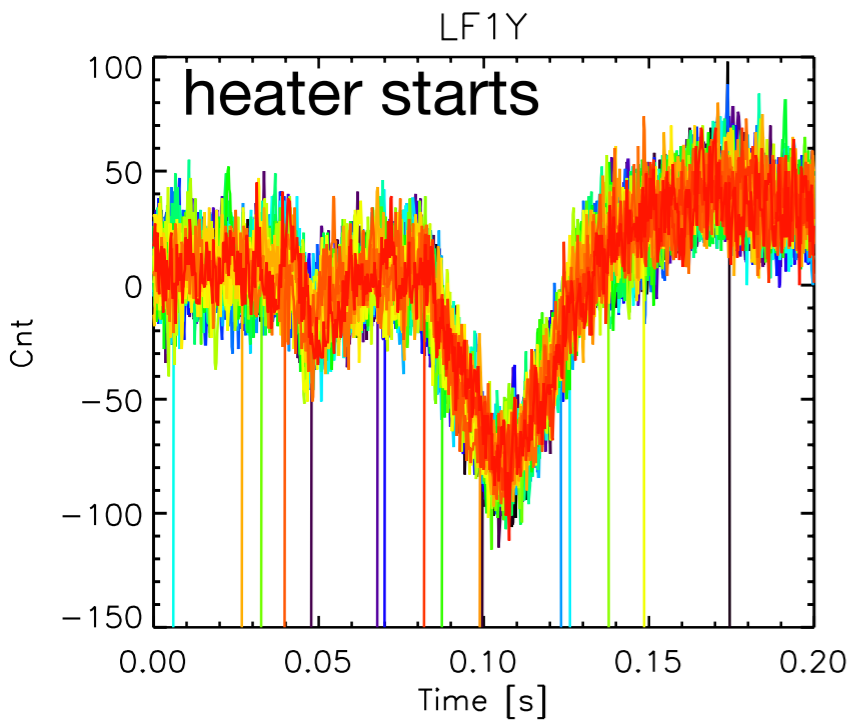

L1 waveforms

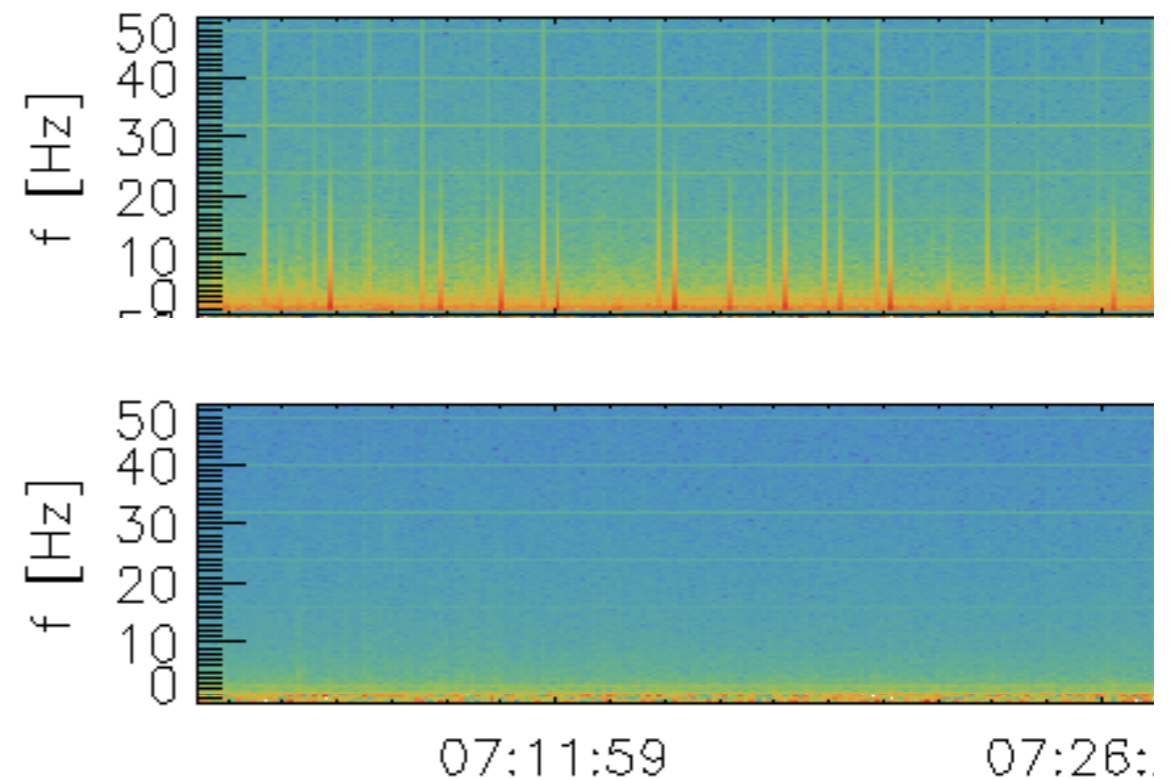

- affect less than 1% of the data
- affects all frequency
- might improve if SCM gets hotter
- some mitigation but not right now

SCM heaters signature

L1 waveforms

L2 waveforms, all frequency affected

- affect less than 1% of the data
- affects all frequency
- might improve if SCM gets hotter
- some mitigation but not right now

Onboard cal, quick look

(k,radial)~130°

To be done

- SCM / MAG timing
- SCM onboard cal
- EMC:
 - Clean 8Hz and co
 - SCM heater signature
 - new stuff:
- TDS/LFM
